**Implementing Drag and Drop**          31

📖 🖨 Expand all | Hide all

You will use wizards to quickly create an application and a project, and a starter JSF page with a simple layout. Then you will add an image component on the page to be used as the drag component in two simple drag and drop actions. An input text component and a listbox will be the components on the page that will act as drop targets for the dragged image.

| Purpose | Duration | Application |
|---|---|---|
| This tutorial shows you how to add drag and drop functionality on a page by defining ADF Faces components as drag sources and drop targets. To see the complete application you will create, click the Download button to download a zip of the final application, and then unzip it in your JDeveloper `mywork` folder. | 40 minutes | ⬇ Download |

**Step 1: Create a New Application and Project**

1. From the main menu, choose **File > New**. In the New Gallery, expand the **General** category and select **Applications**. Then in the **Items** list, select **Custom Application** and click **OK**.
